

URBAN REDEVELOPMENT AUTHORITY OF PITTSBURGH

INTERN PROJECT HANDOVER

LandCare Assurance

For this service period, which assigned parcels were serviced, by whom, and with what evidence.

[ura-gis/land-care-assurance](#)

[/monitoring/](#) · [/kpi/](#) · [/contractor/](#)

rutomo@ura.org (Rizaldy Utomo)

Contractor Compliance and Monitoring was lagging

THE TRIGGER

REPORTED

~11.7%

Blends Active and Request Only parcels, with no stated definition.

THE UNIVERSE

ASSIGNED

1,127

From a tag filter with **no ownership check** — sold parcels stayed in the denominator.

AT STAKE

ANNUAL SPEND

\$775k

Spend judged against evidence that **could not be traced to a parcel**.

WHY I BUILT IT THIS WAY

Outside GIS control: contractor compliance, Regrid's interface, field capacity.

Inside: the assignment query, the schemas, the metric definition, the published app.

A map gives leadership something to act on that a percentage cannot.

WHAT V1.0 DELIVERS

- **Map Monitor** — evidence displayed at the assignment polygon
- **KPI Dashboard** — completion, budget, contractor exposure by period
- **Contractor portal** — pick a parcel on the map or list, submit prefilled evidence
- **A stated metric** — period, denominator, source, and freshness on every number

Nightly ingestion, live query at page load

Period: the 15th of one month
through the 14th of the next

LandCare Assurance

From field evidence to decision-ready maps

DAILY INGESTION

PUBLIC APPLICATION

APPROVED EVIDENCE

SOURCE OF TRUTH

Live ArcGIS at page load
Static JSON = fallback + finance

COMPLETION

Raw matched survey records / Active assigned
Request Only excluded
Not unique parcels

OWNERSHIP SPLIT

GIS and data operations own ingestion and store. Web and dashboard owner owns publish and application.

ADAPTER BOUNDARY

survey-layer.js and **assignment-layer.js** absorb every ArcGIS field rename. **Endpoints live nowhere else.**

DAILY CHECK

4:00 AM upstream ran · 7:00 AM status **success** · Pages workflow green. **A red workflow is a data-contract failure.**

Four blocks in every prompt

AGENTS.md is read automatically by Codex.
Keep it current.

A CONTEXT CALLING – FILES TO READ FIRST

```
Read AGENTS.md, HANDOVER.md,  
docs/landcare-architecture.md,  
docs/landcare-metrics-context.md first.
```

Inherits the source-of-truth and change rules before the agent plans anything.

B CONTRACT – GOAL, SOURCE, METRIC RULE

```
Goal: [outcome and which page it affects].  
Source: [ArcGIS item, table, published JSON].  
Metric rule: completion uses raw assignment-  
matched survey records over Active assigned;  
Request Only is excluded.
```

C TOOL CALLS – WHAT THE AGENT MUST RUN

```
python -m unittest discover -s tests  
node --test tests/survey-layer.test.mjs  
Pages validation checks  
Read-only ArcGIS smoke test
```

@chrome read the live route, its map and console

computer use drive the contractor flow, confirm the prefill

Name the tool in the prompt. Report result, evidence, and rollback before commit.

D CUSTOM SNIPPETS – ADD PER TASK TYPE

Metric change: update the metrics doc and its test in the same change; show before and after for the latest period.

New page or restyle: use the design system rules; no framework, no build step.

Endpoint or field mapping: change only the adapter files; keep normalized property names stable.

Shared adapter: move every importer's ?v= version together.

FOUR FAILURE MODES

Denominator
drift

Stale cache-busting
versions

Hardcoded endpoints outside the
adapters

Hand-editing
docs/landcare/data/

Reusable Style for future GIS Web App

Manrope only · four hues
plus ink, muted, and line neutrals

Map Monitor, live · fixed blue header, pill filters, hairline cards, and status colours always paired with a label.

APP.CSS

~2,800 lines, coupled to the ArcGIS theme. Edit to change an existing page.

EXECUTIVE-BI.CSS

156 portable lines. Copy to start a new dashboard, with design-system/example.html.

TOKENS OVER COMPONENTS

- -bi-primary #006c9f · analysis, active controls
- -bi-deep #00334f · headings, authoritative detail
- -bi-risk #c2410c · action, risk, follow-up
- -bi-success #2e7d32 · target, complete, stable

Override the variables at .bi-dashboard level rather than restyling a component.

FIXED PAGE ORDER

- Masthead
- Tabs
- Context + filters
- Decision question
- 3-5 metrics
- Dominant map or chart
- Operational ledger

Checked in review: colour always paired with a label; every number shows source, period, denominator, freshness; contrast $\geq 4.5:1$; explicit loading, empty, stale, error states.

The scope is one intake form and one export

Assignments, parcel geometry, ownership, dashboard and portal are already URA property

Replace Regrid: an intake cutover

URA already owns the platform

STILL GROUNDED IN ARCGIS

Parcels, assignments, and evidence stay hosted feature layers, queried live at page load. URA owns the intake; Esri carries the geometry and sharing model.

STILL IN DEVELOPMENT

Submitted surveys pipeline need to be checked. Webhook, evidence sync, and layer publisher are written but not deployed, to fully replace regrid. Deploying that path is the last step before cutover.

Keep the source, the metric, and the release path stable

Cutover: HANDOVER.md
Daily ops: task-scheduler-vm-operations.md

Owner operating playbook

Keep the source, metric, and release path stable

OPEN ITEMS FOR THE NEXT OWNER TO DECIDE

Survey123 evidence path is code-complete but not deployed. The single blocker on the replacement.

Survey123 submissions do not change official completion in v1. Whether they should is a governance call.

Pages URLs did not follow the repository rename. Move every ArcGIS embed and bookmark by hand.
